

COMPOST

PlantRight Compost will improve the quality of almost any soil, it's often considered a soil conditioner. By improving the structure & texture of the soil, PlantRight Compost enables your soil to better retain nutrients, moisture, & air for the betterment of your plants.

NUTRIENTS

PlantRight Compost contains a variety of the basic nutrients that plants require for healthy growth. In addition to the main three; nitrogen, phosphorous, & potassium, micronutrients found in compost that are also important for plants to flourish are manganese, copper, iron, & zinc.

BUGS IN YOUR SOIL

PlantRight Compost attracts earthworms & provides them with a healthy diet. The presence of earthworms, redworms, centipedes, sow bugs, & other soil critters shows that PlantRight Compost is a healthy, living material. The presence of these decomposers means that there is still some organic material being slowly broken down releasing nutrients as foods pass through their digestive tracts. They also represent a balanced soil ecology.

RATE OF DECOMPOSITION

PlantRight Compost is made up of different ingredients, some of which rot more rapidly than others. As a result, nutrients are released over a long period of time, like a slow-release fertilizer. If everything decomposed at the same rate, PlantRight Compost wouldn't be able to deliver nutrients to your plants over time..

PLANTRIGHT & PESTS

Research is showing us that soil treated with PlantRight compost tends to produce plants with fewer pest problems. PlantRight Compost helps to control diseases & insects that might otherwise overrun a more sterile soil lacking natural checks against their spread. PlantRight Compost can also help deter fungal diseases.
